

# Not a Simple Solution

Extreme weather risk is about more than the weather. Outcomes depend on who and what is in harm’s way, how vulnerable they are, and how people, places, technology, and policy respond.

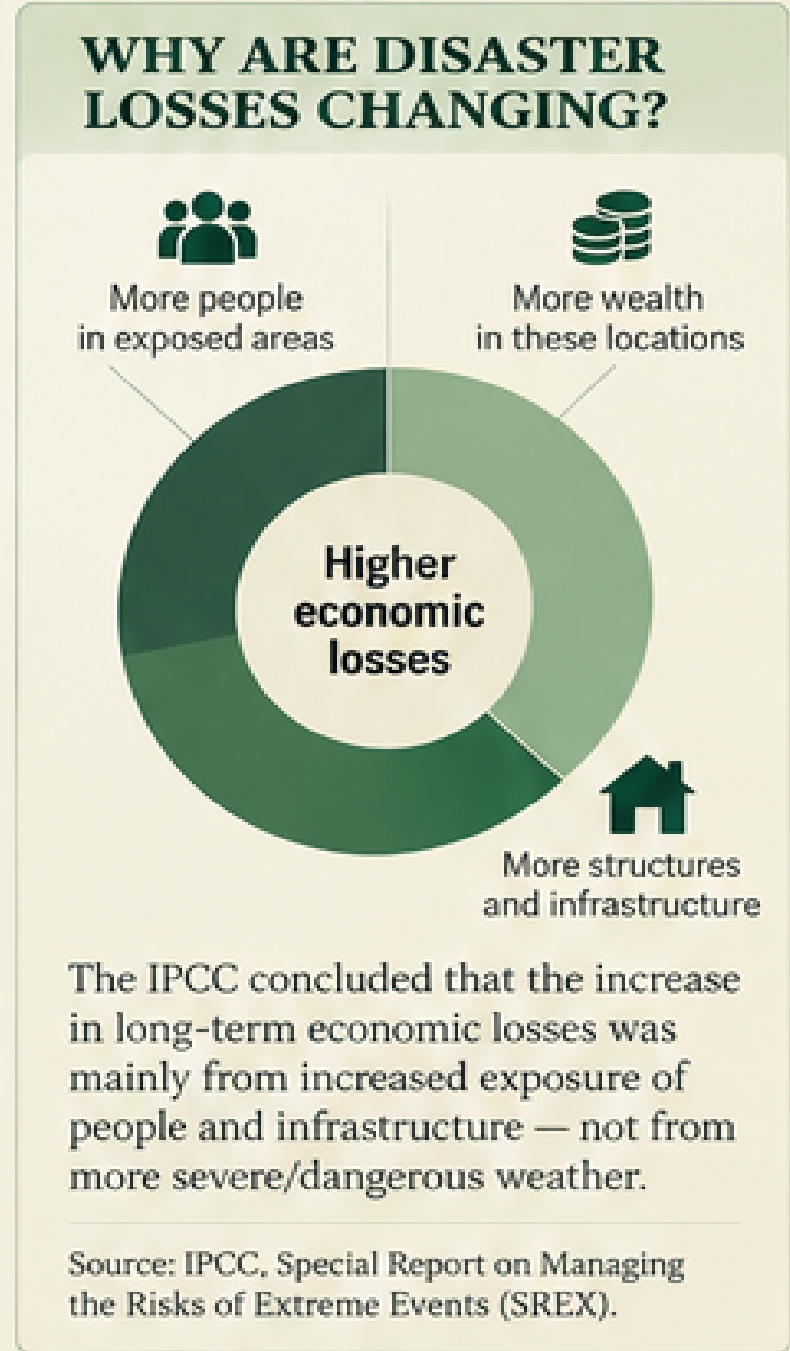

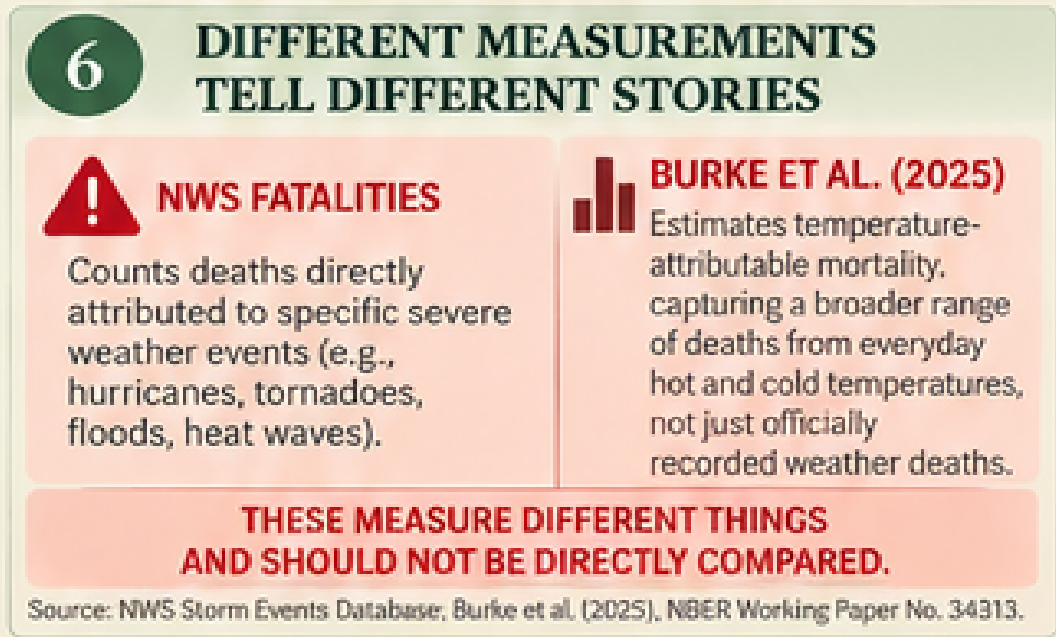

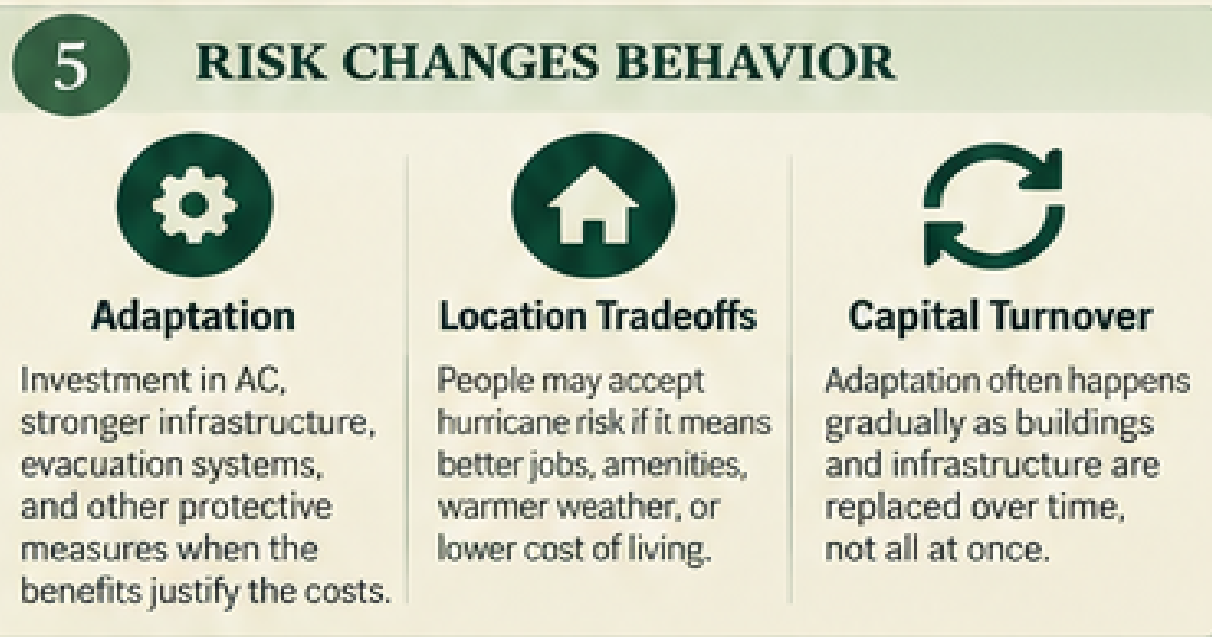

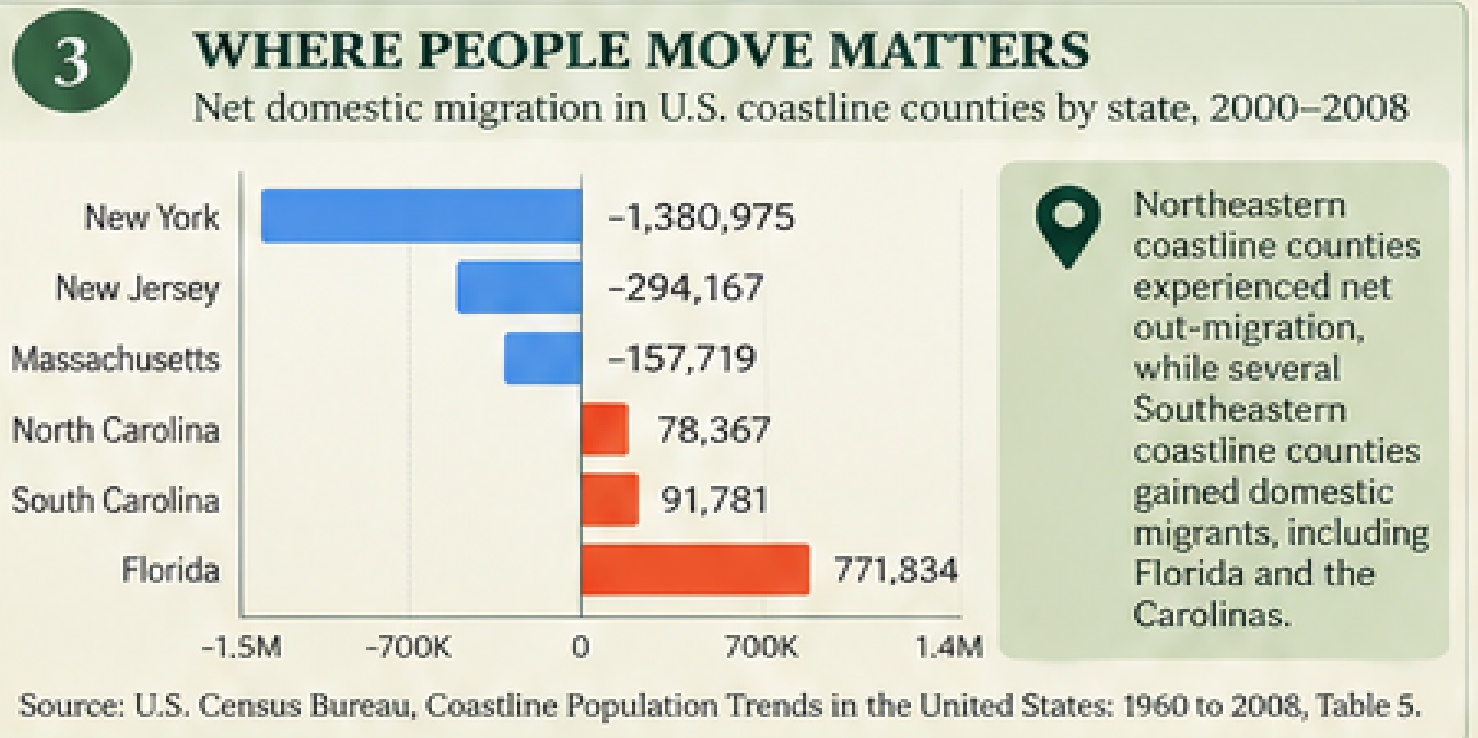

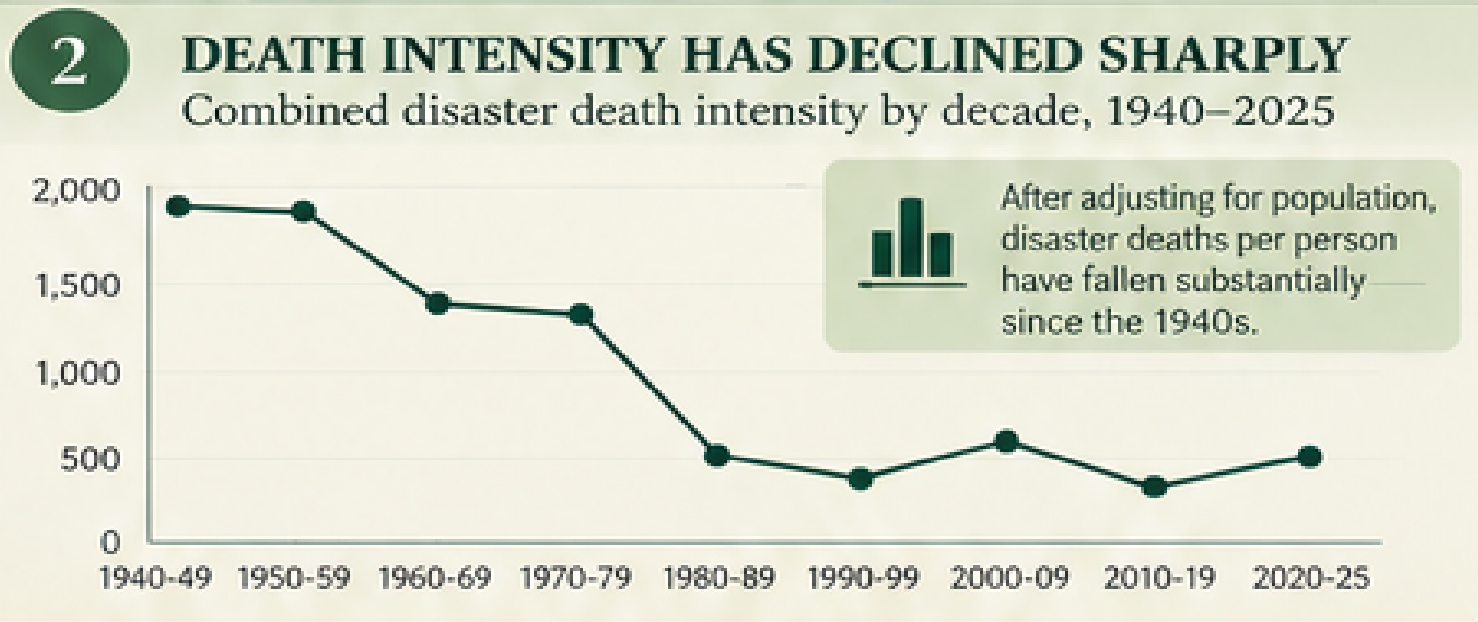

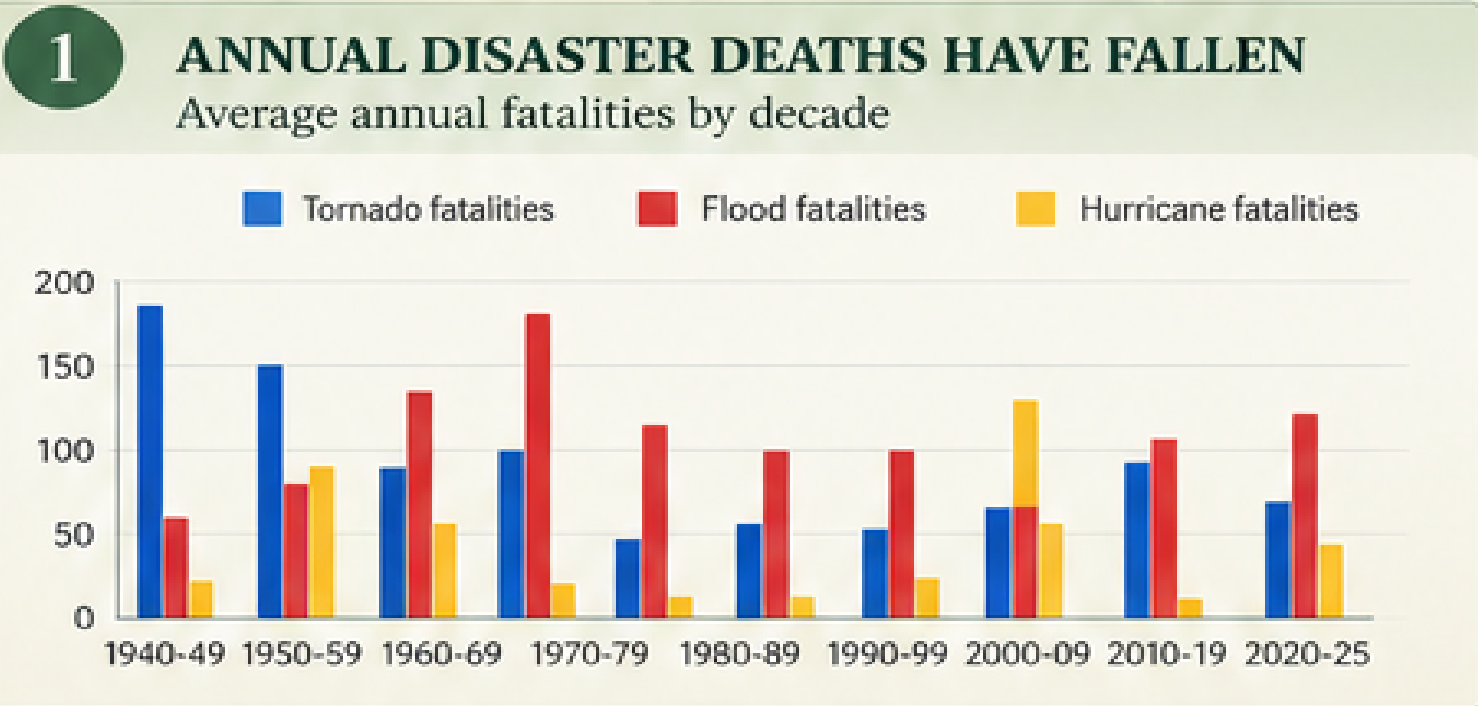

More people.  
More at risk.

U.S. population more than doubled since the 1940s.

Americans have moved into some hurricane-exposed coastal areas.

Yet deaths from natural disasters have not risen proportionally.

Extreme weather creates the hazard.  
People, places, technology, and adaptation help determine the outcome.
